DISCLAIMER

This equipment contains high voltage power supplies. Although the current supply capacity is small, careless use could result in electric shock. It is assumed that this highly specialised equipment will only be used by qualified personnel.

Kentech Instruments Ltd. accept no responsibility for any electric shock or injury arising from use or misuse of this equipment. It is the responsibility of the user to exercise care and common sense with this highly versatile equipment.

1 INTRODUCTION

This manual describes the operation and use of the Kentech Power supply for Photonis P860X Streak Tube. The manual gives the electrical specifications and describes the setting up procedure.

1.1 SPECIFICATIONS

- Five output rails
- Photocathode -15kV
- Quadrupolar lens (QLV) +500V +/- 100V
- Quadrupolar lens (QLH) -500V +/- 100V
- Focus Electrode F2 -5kV +/- 500V
- Focus Electrode B2 -5kV +/- 500V } independent
- Self latching HT enable
- Two interlocks
- universal mains power

2 CIRCUIT DESCRIPTIONS

The circuit has five separate high stability power supplies. Each supply is controlled by a DC control voltage to set the voltage. In addition there are internal potentiometers that are used to set up the start and end voltage of the range available from the front panel, see figure??.

Zener diode chains are used to limit the output voltages in the event of a feedback loop failure of the stabilised supplies. In addition the supplies F2 and B2 are linked with zener chains that limit the voltage between them to ??

Two interlocks are provided. Each output needs to be shorted to ground to allow the unit to turn on the HY. Interlock failure will turn off the HT. We do not recommend that these interlocks be relied upon to protect the image tube, but they will prevent accidental enabling of the supplies.

The supply rails, Photocathode, F2 and B2 also have current monitors on them. Excessive current drawn from these rails will cause the LED on the front panel to illuminate. The thresholds can be set inside the unit, see figure??

Each supply rail also has a built in low voltage monitor point. These have been calibrated to the voltage monitored at the output with a 1GW probe. Note that this may not be quite the voltage that would appear on a tube as the tube will draw less current than the 1GW probe and there is a series current limiting resistor.

The monitor outputs are calibrated on the assumption that they will be connected to a ~~10M~~ input impedance meter.

For rails Photocathode, F2 and B2, the monitor output is 1/1000th of the output voltage. For rails QLV and QLH they are 1/100th.

The output of the photocathode rail can be adjusted via the front panel preset potentiometer with the use of a small screwdriver. The other four rails have multiturn lockable knobs with counters. They are set up so that the centre voltage (counter at 500) corresponds to the centre of the range as stated in the specification.
